SUMMARY

Software developer with two years and eight months on a production loan management platform, working across PHP/MySQL, C#/.NET and React depending on which part of the system I am in. Integrated Nupay debit-order mandates and Nedbank PayShap payments, and I am currently one of two developers moving the platform onto AWS. Looking for a backend or fintech role where I can keep building toward senior engineering.

EXPERIENCE

Junior Software Developer • February 2024 - Present

Future Pro Technology • Durban, KwaZulu-Natal

- Maintain and extend a loan management platform used daily by consultants, vetting, quality control, auditors, collections and HR, with role-based workflows and real-time sync between departments.
- Work across the stack depending on the module: some parts of the platform are PHP/MySQL, others are built in C#/.NET with React on the front end, so I move between the two as the work needs.
- Integrated the Nupay and Nedbank PayShap payment gateway APIs for debit order mandates, loan disbursements, recruiter commissions and client refunds, with error handling and transaction logging so issues can be traced afterward.
- One of two developers, working with an external AWS consultant, moving the platform from shared hosting onto AWS: assessing what the application needs to run across multiple instances, and automating deployments so a release stops being a manual copy onto one server.
- Built REST API endpoints that let the different parts of the system talk to each other: mandate checks, settlement processing and data exchange across companies.
- Went through the slower MySQL queries and added proper indexing, which brought page load times down noticeably.
- Built a client verification flow that automates employment checks, mandate validation and document processing, cutting out a good chunk of the manual vetting work.
- Added an audit trail that logs every file change across departments, from consultant creation through vetting, quality check, payment and auditor review, for compliance and accountability.
- Built a query management system for client requests such as banking detail changes, refunds and contact updates, with status tracking and routing to the right department.
- Cleaned up a legacy PHP codebase: better organization, SQL injection gaps closed and proper input validation added, working through code review with senior developers and Git for branching and releases.

PROJECTS

CreditHub – Multi-Role Loan Management System

Laravel, PHP 8.4, React 19, TypeScript, MySQL, Tailwind, Pest, GitHub Actions • github.com/MoroesiR/CreditHub • live demo: credithub-demo.onrender.com

- A complete lending pipeline built in my own time: client registration and affordability, credit decision, signed agreement, disbursement, collections and recruiter commission.
- Separation of duties across six roles, where no role holds more than one of the four permissions that move a loan forward, and the permission is declared on the route rather than checked in the interface.
- Priced on reducing balance with National Credit Act fee caps, and receipts applied in the statutory order of interest, then fees, then capital.
- Append-only audit trail on every state change, tests over the money paths, and CI running formatting, type checks and tests on every push.

AssetFlow – IT Asset Management System

ASP.NET Core 10, C#, Entity Framework, SQL Server, Razor Pages, Bootstrap, Chart.js, Swagger • github.com/MoroesiR/AssetFlow

- Full-stack web app for tracking IT equipment, managing employee checkouts and scheduling preventive maintenance across departments.
- Handles the full asset lifecycle: automated status tracking, duplicate serial number prevention, and checkout against a department with overdue indicators and a condition assessment on return.
- Interactive dashboard (Chart.js) for asset value distribution, checkout trends and maintenance schedules, with CSV export, and a REST API documented with Swagger.

SKILLS

Languages: PHP, JavaScript, C#, Python, SQL

Frontend: React, TypeScript, HTML, CSS, Bootstrap, Tailwind, responsive & adaptive design

Frameworks & Libraries: ASP.NET Core, Laravel, React, WordPress, jQuery, AJAX

Databases: MySQL, SQL Server, Entity Framework Core

APIs & Integration: RESTful API design and consumption, payment gateway integration (Nupay, Nedbank PayShap), JSON/XML data handling

Tools & Platforms: Git & GitHub, GitHub Actions, Visual Studio, VS Code, Postman, Swagger, Chrome DevTools

Currently Learning: Docker, AWS

EDUCATION

Durban University of Technology

2021-2023 • Diploma in ICT: Applications Development

- Took part in a Collaborative Online International Learning (COIL) initiative with students from Brazil.

Tholang Senior Secondary School

2016-2018 • Grade 12 / Matric

- Took part in the Math Olympiad in Grade 11.

CERTIFICATES

- Programming for Everybody (Python) – University of Michigan, Coursera (2023)
- Python Data Structures – University of Michigan, Coursera (2023)
- Cybersecurity Essentials – Cisco Networking Academy (2021)
