SUMMARY

Software developer with over two years on the internal loan management systems of 12 companies, some built in PHP with MySQL and others in C# on .NET with React. I've integrated Nupay debit-order mandates and Nedbank PayShap payments and built them to be safe to retry and fully traceable, and I'm one of two developers moving these systems onto AWS. I'm looking for a backend or fintech role where I can keep building toward senior engineering.

EXPERIENCE

Junior Software Developer • February 2024 – Present

Future Pro Technology • Durban, KwaZulu-Natal

- Maintain and extend the internal loan management systems used by 12 companies, each on its own database schema, and set up a new system each time a company is brought on, with role-based workflows for consultants, vetting, quality control, pay master, auditors, collections and HR.
- Work across both stacks the business runs, PHP with MySQL on some of the systems and C# on .NET with React on the others, moving between them as the work needs.
- Integrated the Nupay and Nedbank PayShap payment gateway APIs for debit-order mandates, loan disbursements, recruiter commissions and client refunds, with error handling and transaction logging so any issue can be traced afterwards.
- Made payments safe to retry. A mandate request is sent once, and a mandate left behind by a timeout is recovered instead of duplicated. If the bank has not confirmed a refund, it is held so it is never paid twice. Every payout also carries a company-specific bank statement reference so finance can reconcile it.
- One of two developers, working with an external AWS consultant, moving these systems from shared hosting onto AWS. Built the health check for the load balancer and CodeDeploy, a container runner for background workers and scheduled jobs, and S3 document storage, and moved every secret out of the code into environment configuration, working toward automated releases in place of copying files by hand onto one server.
- Built the REST API endpoints the systems use to talk to each other, covering mandate checks, settlement processing and data exchange across companies.
- Went through the slowest MySQL queries and added proper indexing, which made pages load noticeably faster.
- Built a client verification flow that automates employment checks, mandate validation and document processing, with bank-specific account rules and duplicate ID checks, which cut out much of the manual vetting work.
- Added an audit trail that logs every change to a file across departments, from the consultant through vetting, quality check, payment and auditor review, plus a handover trail recording who held each file and for how long, for compliance and accountability.
- Built a query management system for client requests such as banking detail changes, refunds, settlements and cancellations, with status tracking and routing to the right department.
- Cleaned up legacy PHP and C# code: better organisation, SQL injection gaps closed and proper input validation added, working through code review with senior developers, Git branching and a standards check in CI.

PROJECTS

CreditHub – Multi-Role Loan Management System

Laravel, PHP 8.4, React 19, TypeScript, MySQL, Tailwind, Pest, GitHub Actions • github.com/MoroesiR/CreditHub • live demo: credithub-demo.onrender.com

- A complete lending pipeline built in my own time, covering client registration and affordability, credit decision, signed agreement, disbursement, collections and recruiter commission.
- Separation of duties across six roles. No role holds more than one of the four permissions that move a loan forward, and each permission is declared on the route rather than checked in the interface.
- Loans are priced on a reducing balance with National Credit Act fee caps, and receipts are applied in the statutory order: interest, then fees, then capital.
- An append-only audit trail records every state change, tests cover the money paths, and CI runs formatting, type checks and tests on every push.

AssetFlow – IT Asset Management System

ASP.NET Core 10, C#, Entity Framework, SQL Server, Razor Pages, Bootstrap, Chart.js, Swagger • github.com/MoroesiR/AssetFlow

- A full-stack web app for tracking IT equipment, managing employee checkouts and scheduling preventive maintenance across departments.
- Covers the whole asset lifecycle, with automatic status tracking, duplicate serial number prevention, department checkouts with overdue indicators, and a condition check when an asset is returned.
- An interactive Chart.js dashboard shows asset value distribution, checkout trends and maintenance schedules, with CSV export and a REST API documented in Swagger.

SKILLS

Languages: PHP, C#, JavaScript, TypeScript, SQL, Python

Frontend: React, TypeScript, HTML, CSS, Bootstrap, Tailwind, responsive and adaptive design

Frameworks & Libraries: ASP.NET Core, Laravel, React, WordPress, jQuery, AJAX

Databases: MySQL (indexing, migrations), SQL Server, Entity Framework Core

APIs & Integration: RESTful API design and consumption, payment gateway integration (Nupay, Nedbank PayShap), JSON/XML data handling

Cloud & DevOps: AWS (S3, CodeDeploy, load balancing) through the current migration, GitHub Actions, Docker (learning)

Tools: Git & GitHub, Visual Studio, VS Code, Postman, Swagger, Chrome DevTools

EDUCATION

Durban University of Technology

2021–2023 • Diploma in ICT: Applications Development

- Took part in a Collaborative Online International Learning (COIL) initiative with students from Brazil.

Tholang Senior Secondary School

2016–2018 • Grade 12 / Matric

- Took part in the Math Olympiad in Grade 11.

CERTIFICATES

- Programming for Everybody (Python) – University of Michigan, Coursera (2023)
- Python Data Structures – University of Michigan, Coursera (2023)
- Cybersecurity Essentials – Cisco Networking Academy (2021)
